# Micro Shell Dual Alarming Ink Tag

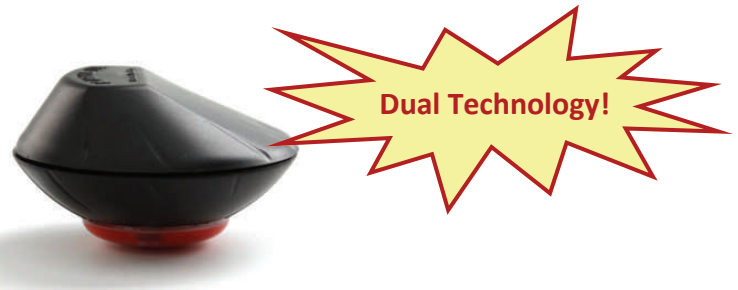

World's First Dual Technology Tag With Ink

## Significant Advantage Over Traditional Tags

- ◆ Dual technology with ink makes this tag the most versatile on the market.
- ◆ Stock one tag instead of two.
- ◆ Large ink ampoule provides an immediate visual deterrent.
- ◆ Alerts store personnel by setting off 58Khz and 8.2Mhz EAS detection systems.

**Micro Shell Alarming Ink Tag** employs a dual alarming technology where the same tag can be detected by both **58Khz** and **8.2Mhz** systems. WG has eliminated the need for ordering two types of tags. One tag will suffice for either technology to alert security if removal from the premises is attempted. This tag also includes a large **ink-filled ampoule** securely molded into the tag case that deters the shoplifter from removing the tag without damaging the article.

**Lanyard Tag** is quite commonly used in applications where a pin cannot be used to penetrate the article. The cable is routed through openings in the article. Cable length can be varied to accommodate the type of article.

**Golf Club and Baseball Bat Tags** are constructed of very light material, the customer may swing the item without effect on the club/bat "feel". The tags employ a secure locking device and are opened with standard magnetic detachers. They also include imbedded ferrite material for EAS alarm detection.

**Pencil Tags** are commonly available in a variety of sizes and detection distances.
