

Clear Ink

Information

Have you considered incorporating a benefit denial tag?

Benefit denial is an excellent option for deterring thieves from targeting products. While it can serve as an alternative to EAS, best practices dictate its use in conjunction with alarmed tags. When employed together, EAS and benefit denial ensure fewer tags are tampered with, alert staff to theft incidents, and thwart any attempts to remove tags by denying thieves any benefits.

If a shoplifter attempts to forcibly detach a Clear Ink Tag from its locking device, the ink vials will burst, permanently defacing the garment as ink spills onto it. Statistics indicate that shoplifters are dissuaded from theft when the targeted merchandise becomes unwearable and unsellable. The Clear Ink Tag can be affixed to merchandise in various ways. In a "stand-alone" mode, the tag is paired with a locking mechanism known as a "clutch." For retailers utilizing EAS, the Clear Ink Tag seamlessly integrates with any EAS tag, providing an additional layer of protection. The patented "Breakage Indicator Panel" on the top of the Clear Ink Tag ensures ink dispersal in all directions. This panel also serves as a visual signal to the retailer, indicating tampering or breakage of the ink tag.
